

CoreData

Persistent Container se lazy inicijalizuje u AppDelegate

```
lazy var persistenceContainer: NSPersistenceContainer = {  
  
    let container = NSPersistenceContainer(name: "NAZIV BAZE")  
    container.loadPersistentStores(completionHandler: { (storeDescription, error) in  
  
        if let error = error as NSError? {  
            fatalError("Unresolved error \(error)")  
        }  
    })  
    return container  
}  
  

---

  
func saveContext() {  
  
    let context = persistenceContainer.viewContext  
    if context.hasChanges {  
        do {  
            try context.save()  
        } catch {  
            let nsError = error as NSError  
            fatalError("Unresolved error \(nsError)")  
        }  
    }  
}
```

Ovo se automatski dobija ako se stiklira CoreData na pocetku projekta, ali ako je potrebno naknadno dodati CoreData u projekat onda ubaci ovo u AppDelegate sam. I ukoliko nije vec ubaceno potrebno je `self.saveContext()` ubaciti u `applicationWillTerminate()`
